

The Impact of Remote Work on Organizational Productivity: A Longitudinal Study

Abstract

This paper examines the relationship between remote work arrangements and measured productivity outcomes across 340 organizations over a five-year period.

Introduction

Since 2020, remote work has fundamentally altered how organizations structure labor. Prior research suggests mixed effects on output across sectors.

Methodology

We employed a mixed-methods approach combining survey data with productivity metrics collected from participating organizations across multiple industries.

Results

Our findings indicate a statistically significant correlation between hybrid work models and self-reported job satisfaction, though productivity effects varied considerably by industry sector and organizational size.

Conclusion

Further research is needed to establish causal mechanisms behind these effects.
